HEURISTIC EVALUATION

WHAT IS HEURISTIC EVALUATION?

Heuristic evaluation is a process where experts use rules of thumb to measure the usability of user interfaces in independent walkthroughs and report issues.
Evaluators use established heuristics (e.g, Nielsen-Molich's) and reveal insights that can help design teams enhance product usability from early in development.

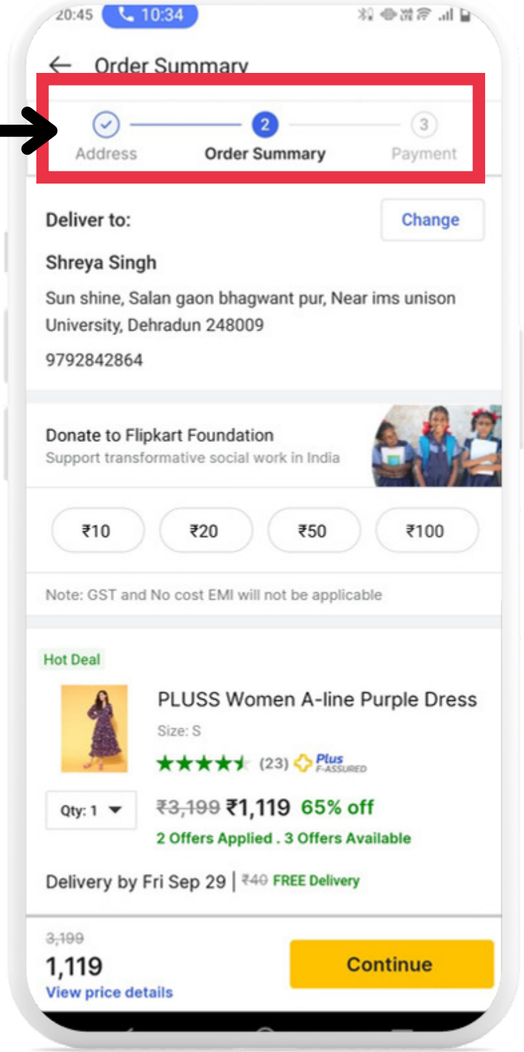
About Flipkart

Flipkart brings you the joy of discovery with a hug selection of original products from mobiles, fashion, electronics, home appliances, groceries and more- making it the one stop shop for everything you need. with huge discounts on almost everything, extra supercoins with every purchase, rewards for playing games and timely alert on events dates, deals, and updates - the app is build for easy convenience.

Visibility of System Status

Flipkart effectively informs users about the loading statuses. Flipkart always lets users know what's going on, like when pages are loading or payments are being made.

This shows that the order is being processed.

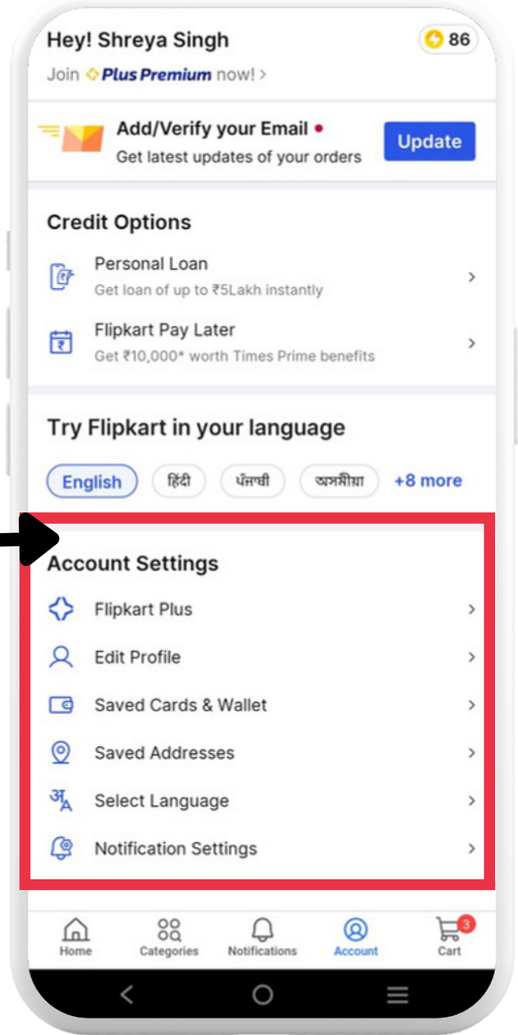


This is telling us that the item we have searched is in process.

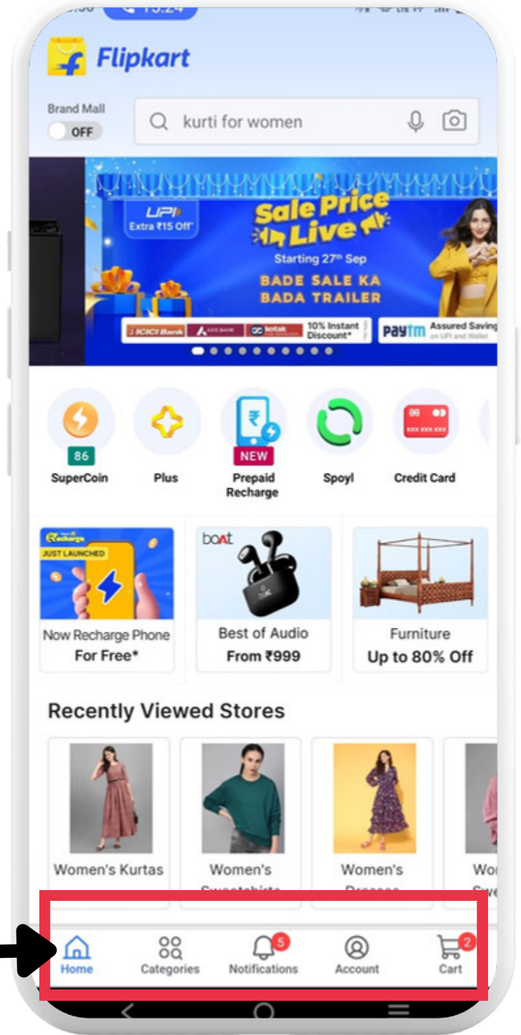
Match between System and the Real World

The Flipkart app uses symbols and words that people easily recognize, like a cart for buying and a magnifying glass for searching.

These icons tell what their function is.



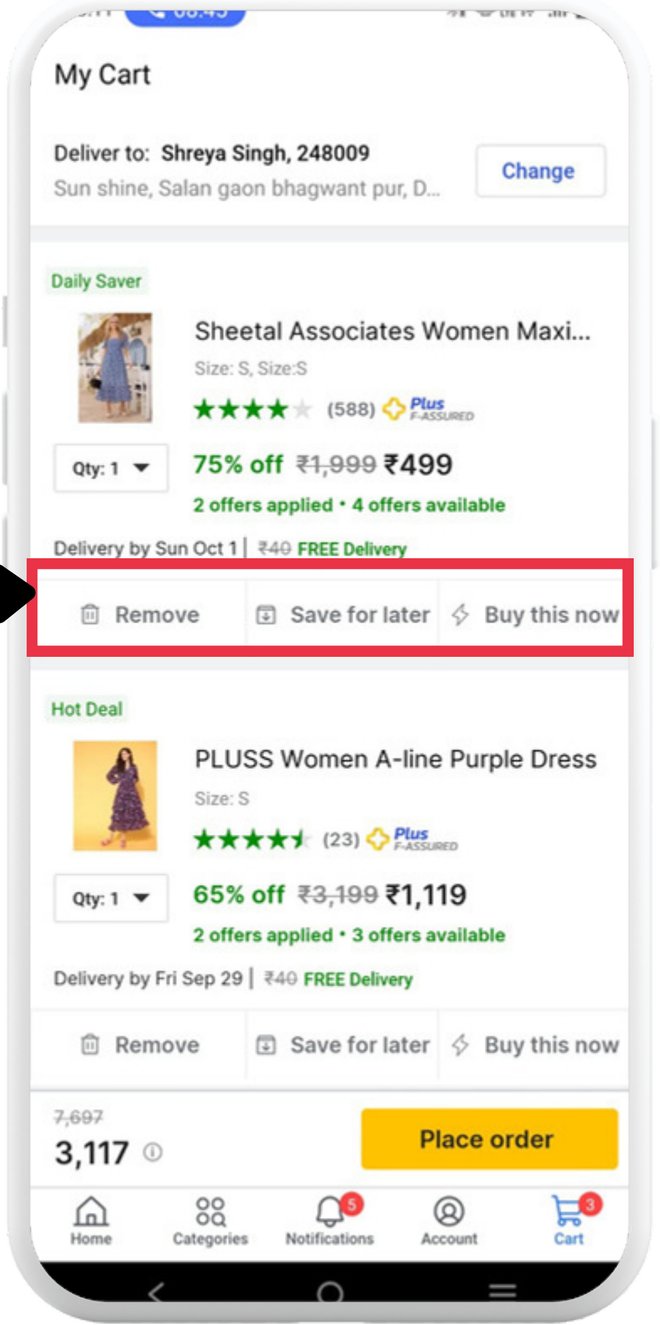
these icons are very easily understandable by people



User Control and Freedom

User can easily navigate back and forth in the app. Like, if someone accidentally adds something to their shopping cart, they can quickly take it out.

Flipkart provides us options that we can remove any item from our cart and buy it.



Consistency and Standards

The Flipkart app keeps things steady and predictable. No matter where you go in the app, it looks and feels the same.

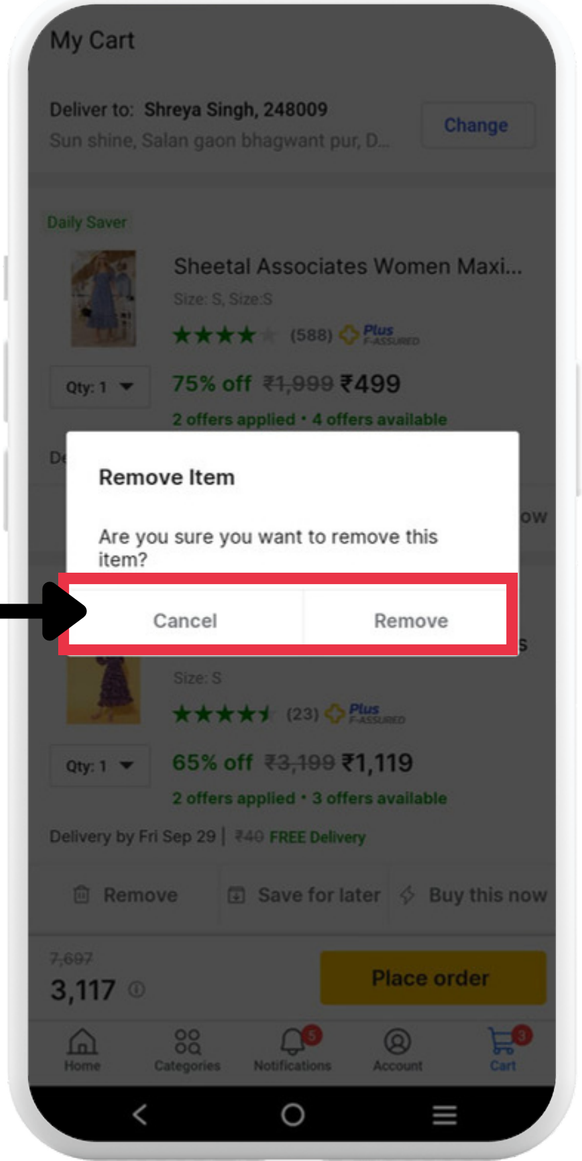
Error Prevention

Before making a purchase, users are given ample opportunity to review their order, preventing accidental purchased.

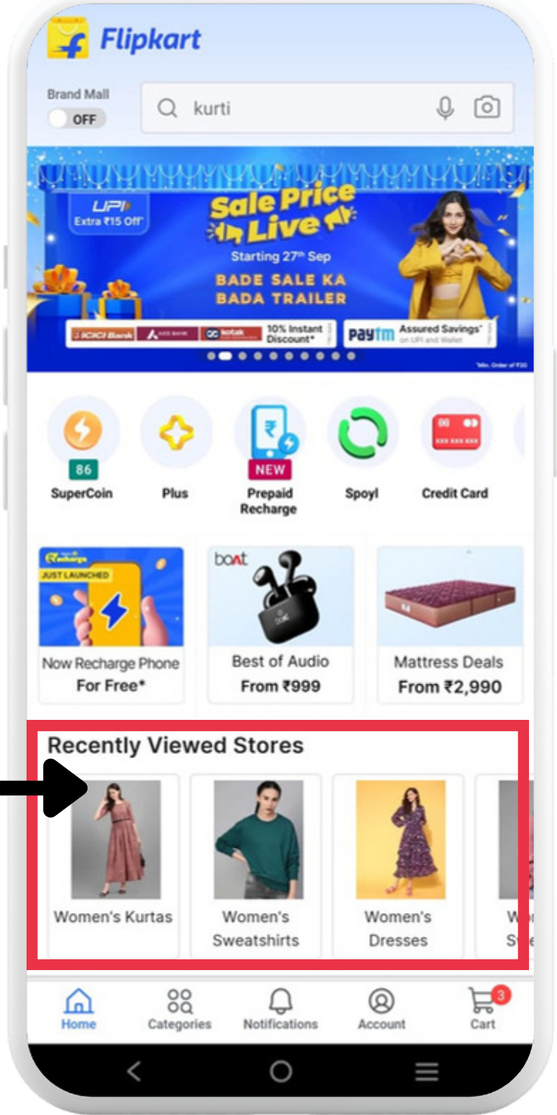
Flipkart provides us options that we can remove any item from our cart and buy it.



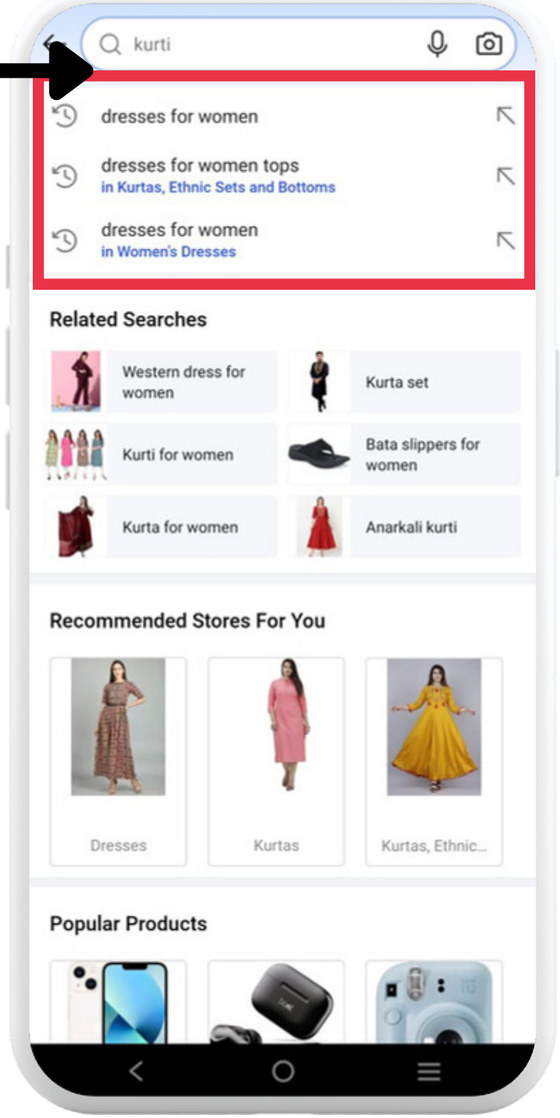
Recognition Rather Than Recall

The Flipkart app remembers what you've looked at and searched for. It suggests products you might like and shows items you recently checked out.

Flipkart suggests items on the front page based on our past searches



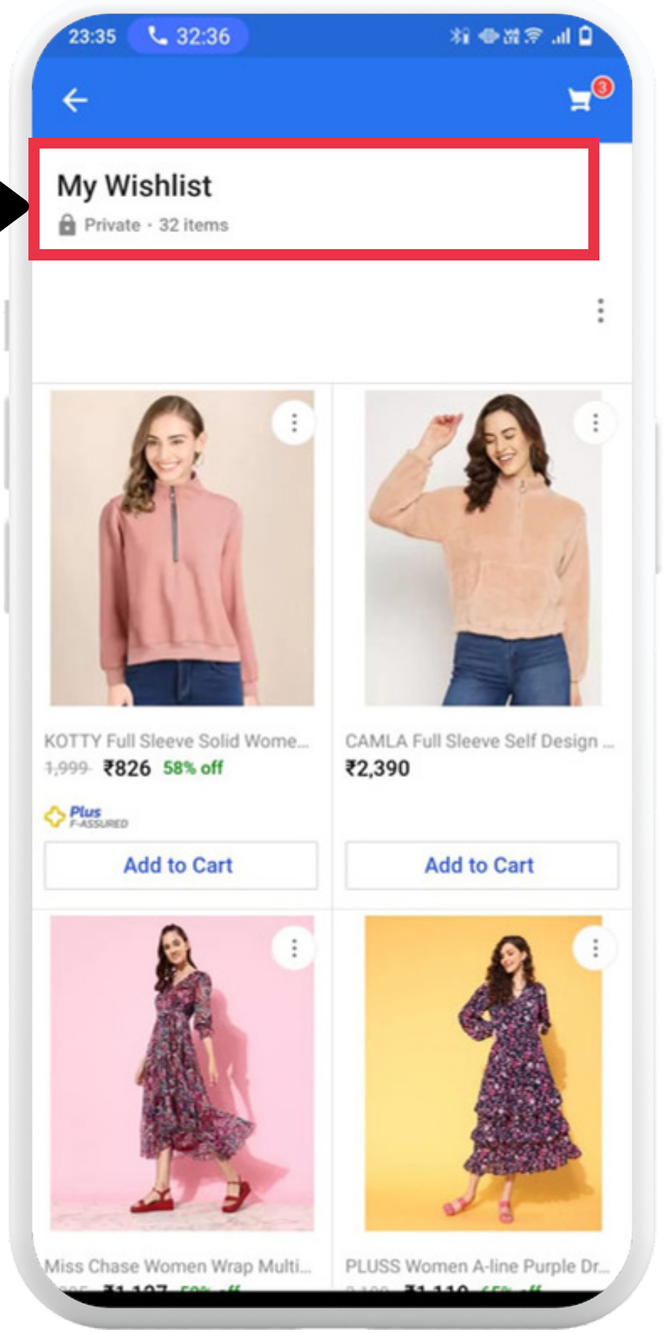
Flipkart also shows our search history so that if we want to search any of them then we can search easily.



Flexibility and Efficiency of Use

For regular users, the app offers features like quick re-ordering, wish lists, and easy access to frequently browsed categories.

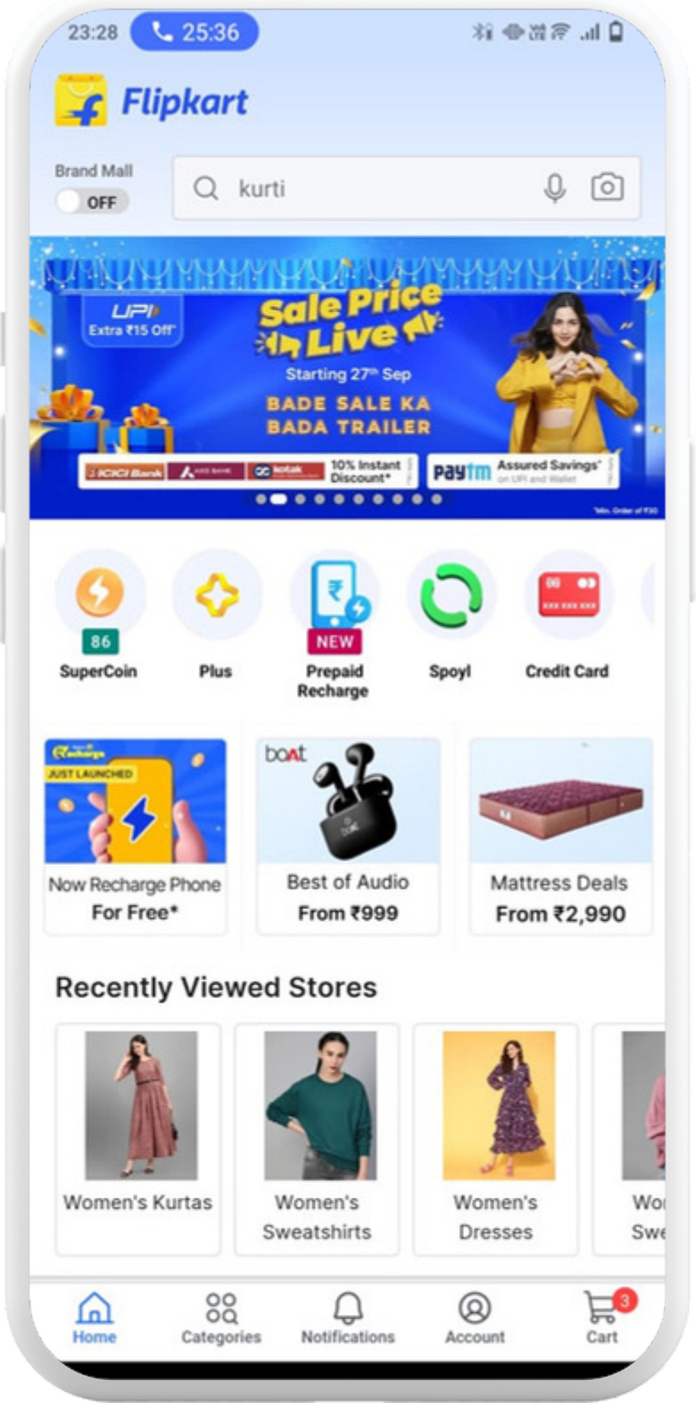
Flipkart provides confirmation options for us



Aesthetic and Minimalist Design

The Flipkart app has a neat design that mainly highlights products.

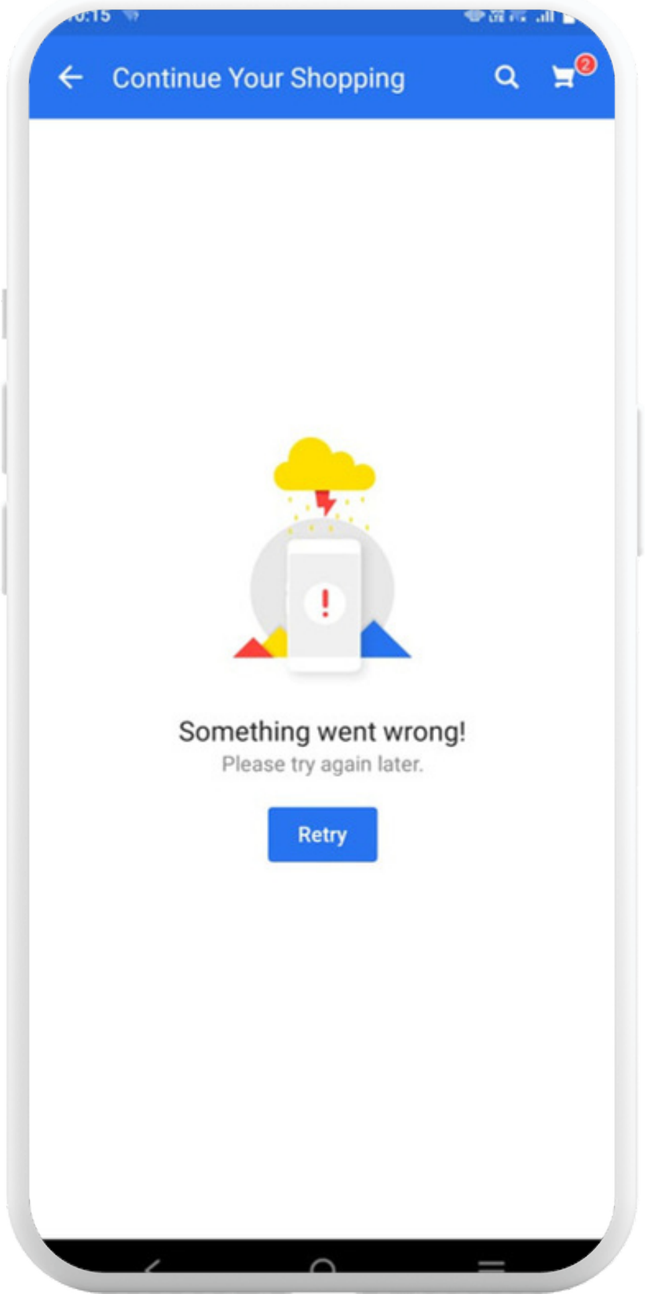
Product suggestions are visible on the home page of Flipkart.



Help Users Recognize, Diagnose, and Recover from Errors

When using the Flipkart app, if something goes wrong, like a payment not going through or a page not opening, the app tells you clearly what happened.

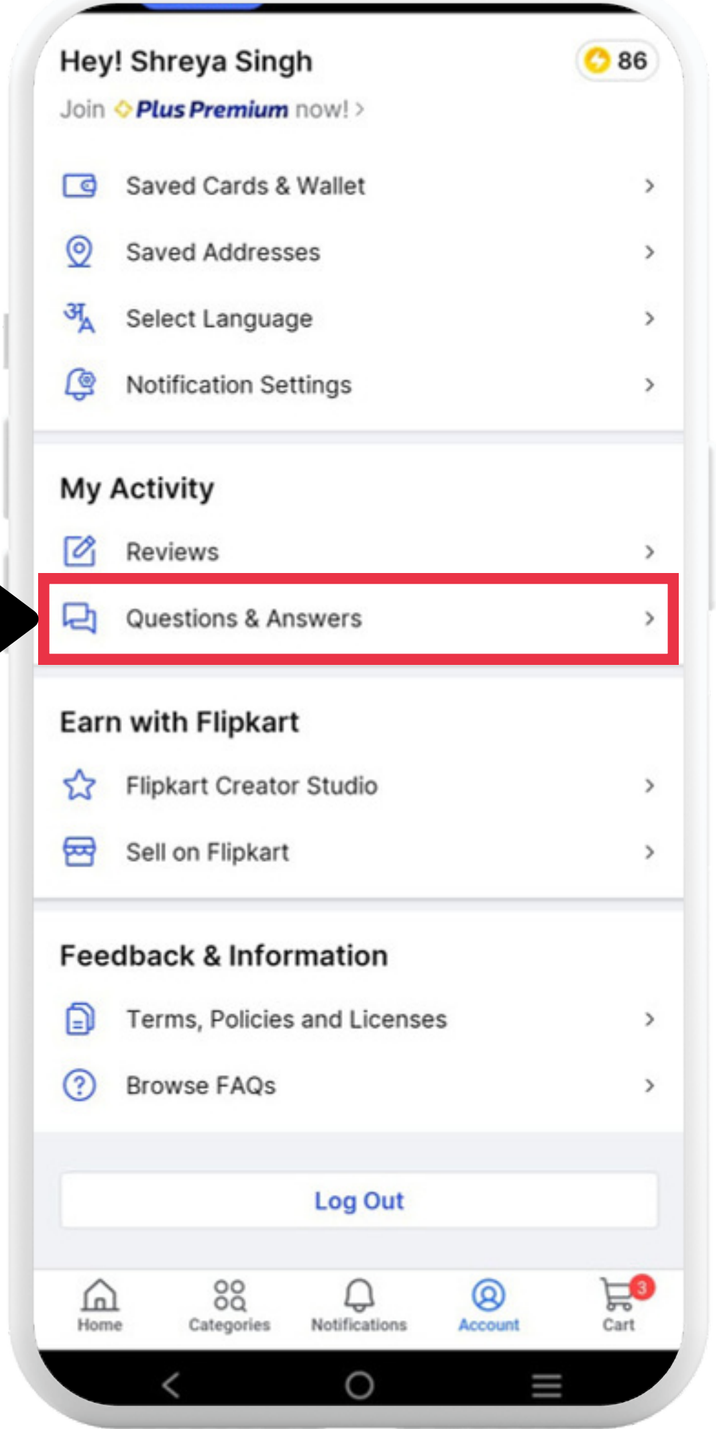
This error is clearly showing that our process has failed and we will have to retry.



Help and Documentation

The Flipkart app has a special area where you can find answers to common questions.

Flipkart provides us with the option of Questions and Answers for help and queries.



Heuristic Evaluation Sheet

Evaluator	Shreyshi,Shreya Singh
Date	22 sep,2023
Website/App	Flipkart
Device	Shreyshi,Shreya Singh
Browser/OS	ios
Task/Feature	Heuristic Evaluation

- I don't agree that this is a usability problem at all
- Cosmetic problem only: need not be fixed unless extra time is available on project
- Minor usability problem: fixing this should be given low priority
- Major usability problem: important to fix. so should be given high priority
- Usability catastrophe, imperative to fix this before product can be released

1. Visibility of system status	Issues	Recommendation
The system should always keep users informed about what is going on, through appropriate feedback within reasonable time. **Severity** 0 1 2 3 4	Unclear feedback when a product is added to the cart or when a page is loading.	Implement clear visual and textual feedback, like a short pop-up message confirming that an item was added to the cart or a clear loading indicator.

2. Match between system and the real world	Issues	Recommendation
The system should speak the users language, with words phrases and concepts tamblar to the user, rather than systert-criented terms. Follaw real-world conventions, making information appear in natural and logical order, **Severity** 0 1 2 3 4	Product categorizations might not match user expectations.	Use more intuitive categorizations and possibly conduct user surveys to understand how users perceive product groupings.

3. User Control and Freedom	Issues	Recommendation
Users often perform actions by mistake. They need a clearly marked "emergency exit" to leave the unwanted action without having to go through an extended process. **Severity** 0 1 2 3 4	Difficulty in undoing actions, like accidentally removing items from the wish list.	Introduce an "Undo" option or confirmation pop-ups for critical actions.

4. Consistency and Standards	Issues	Recommendation
Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform and industry conventions. **Severity** 0 1 2 3 4	Varying product details formats across sellers.	Enforce a standard template for sellers to provide product details.

5. Error Prevention

Good error messages are important, but the best designs carefully prevent problems from occuring in the first place. Either eliminate error-prone conditions, or check for them and present users with a confirmation option before they commit to the action.

Severity

0 1 2 3 4

Issues	Recommendation
Users might accidentally adjust product quantities in the cart.	Make touch targets larger and separate them from other clickable elements.

6. Recognition Rather Than Recall

Minimize the user's memory load by making elements, actions, and options visible. The user should not have to remember information from one part of the interface to another. Information required to use the design should be visible or easily retrievable when needed.

Severity

0 1 2 3 4

Issues	Recommendation
The search doesn't always prioritize recently viewed or related products.	Enhance the search algorithm to prioritize user's recent interactions and preferences.

7. Flexibility and Efficiency of Use

Shortcuts — hidden from novice users — may speed up the interaction for the expert user such that the design can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

Severity

0 1 2 3 4

Issues	Recommendation
No streamlined way for frequent shoppers to re-order.	Introduce a "Reorder" feature in the order history section

8. Aesthetic and Minimalist Design

Interfaces should not contain information which is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

Severity

0 1 2 3 4

Issues	Recommendation
Excessive promotional banners clutter the interface.	Limit promotional banners on the homepage and ensure they don't overshadow primary content.

9.Help Users Recognize, Diagnose, and Recover from Errors	Issues	Recommendation
Error messages should be expressed in plain language (no error codes), precisely indicate the problem, and constructively suggest a solution.	Generic error messages.	Use more descriptive error messages and guide users towards a solution.

Severity

0 1 2 3 4

10. Help and Documentation	Issues	Recommendation
It's best if the design doesn't need any additional explanation. However, it may be necessary to provide documentation to help users understand how to complete their tasks.	Hard-to-find FAQ or Help sections.	Make the Help section more prominent, possibly with an always-accessible button or icon in the app.

Severity

0 1 2 3 4

THANK YOU
